

# **Intel® Core™ Ultra Processors (Series 2)**

Intel® Core™ Ultra Processors (Series 2) Specification Update

Rev. 007 April 2025

Doc. No.: 834774, Rev.: 007

You may not use or facilitate the use of this document in connection with any infringement or other legal analysis concerning Intel products described herein. You agree to grant Intel a non-exclusive, royalty-free license to any patent claim thereafter drafted which includes subject matter disclosed herein.

No license (express or implied, by estoppel or otherwise) to any intellectual property rights is granted by this document.

Intel technologies' features and benefits depend on system configuration and may require enabled hardware, software or service activation. Performance varies depending on system configuration. No computer system can be absolutely secure. Check with your system manufacturer or retailer or learn more at intel.com.

Intel technologies may require enabled hardware, specific software, or services activation. Check with your system manufacturer or retailer.

The products described may contain design defects or errors known as errata which may cause the product to deviate from published specifications. Current characterized errata are available on request.

Intel disclaims all express and implied warranties, including without limitation, the implied warranties of merchantability, fitness for a particular purpose, and non-infringement, as well as any warranty arising from course of performance, course of dealing, or usage in trade.

Altering clock frequency, voltage, or memory interface speeds may void any product warranties and reduce stability, security, performance, and life of the processor and other components. Intel has not validated processor running memory above Plan-Of-Record (POR) speed. DRAM/DIMM devices should support desired speed, check with DRAM/DIMM vendors for details. System manufacturers are responsible for all validation and assume the risk of any stability, security, performance, or other functional issues resulting from such alterations.

All information provided here is subject to change without notice. Contact your Intel representative to obtain the latest Intel product specifications and roadmaps

## **Revision History**

| Document<br>Number | Revision<br>Number | Description  | Revision Date    |
|--------------------|--------------------|--|------------------|
|                    | 001                | Initial Revision – Includes errata ARL001-<br>ARL018   | October 2024     |
|                    | 002                | Added Erratum: <u>ARL019</u>   | November<br>2024 |
|                    | 003                | Added Errata: <u>ARL020</u> , <u>ARL021</u> , <u>ARL022</u><br>Removed Erratum ARL003  | December<br>2024 |
| 834774             | 004                | Added S 6+8, HX, H and U series processors  Added Errata: ARL023, ARL024, ARL025,  ARL026, ARL027                                | January 2025     |
|                    | 005                | Added Erratum: <u>ARL028</u>   | February 2025    |
| 000                | 006                | Added Errata: <u>ARL029</u> , <u>ARL030</u> , <u>ARL031</u> ,<br><u>ARL032</u> , <u>ARL033</u><br>Updated Erratum: <u>ARL001</u> | March 2025       |
|                    | 007                | Added Erratum: <u>ARL034</u> Updated Erratum: <u>ARL032</u> Removed Erratum: ARL014 Updated CPUID Table                          | April 2025       |

### **Preface**

This document is an update to the specifications contained in the documents listed in the following <u>Affected Documents/Related Documents</u> table. It is a compilation of device and

5

document errata and specification clarifications and changes and is intended for hardware system manufacturers and for software developers of applications, operating system, and tools.

Information types defined in the Nomenclature section of this document are consolidated into this updated document and are no longer published in other documents. This document may also contain information that has not been previously published.

### Affected Documents

#### Nomenclature

Errata – These are design defects or errors. Errata may cause the processor's behavior to deviate from published specifications. Hardware and software designed to be used with any given stepping must assume that all errata documented for that stepping are present on all devices.

Specification Changes - These are modifications to the current published specifications. These changes will be incorporated in the next release of the specifications.

Specification Clarifications - These describe a specification in greater detail or further highlight a specification's impact to a complex design situation. These clarifications will be incorporated in the next release of the specifications.

**Documentation Changes –** These include typos, errors, or omissions from the current published specifications. These changes will be incorporated in the next release of the specifications.

Note: Errata remain in the specification update throughout the product's lifecycle or until a stepping is no longer commercially available. Under these circumstances, errata removed from the specification update are archived and available upon request. Specification changes, specification clarifications, and documentation changes are removed from the specification update, when the appropriate changes are made to the appropriate product specification or user documentation (datasheets, manuals, etc.)

### **Identification Information**

Component Identification via Programming Interface

The processor stepping is identified by the following register contents:

Table 2-1. Component Identification

| Produ<br>ct           | Step<br>ping | CPUI<br>D  | Reser<br>ved<br>[31:2<br>8] | Exten<br>ded<br>Famil<br>y<br>[27:2 | Exte<br>nded<br>Mod<br>el<br>[19:1 | Rese<br>rved<br>[15:1<br>4] | Proce<br>ssor<br>Type<br>[13:1<br>2] | Fa<br>mil<br>y<br>Co<br>de<br>[1<br>1:8 | Mod<br>el<br>Nu<br>mbe<br>r<br>[7:4 | Step<br>ping<br>ID<br>[3:0] |

The Extended Family, Bits [27:20] are used in conjunction with the Family Code, specified in Bits[11:8], to indicate whether the processor belongs to the Celeron<sup>®</sup>, Pentium<sup>®</sup>, or Intel<sup>®</sup> Core<sup>™</sup> processor family.

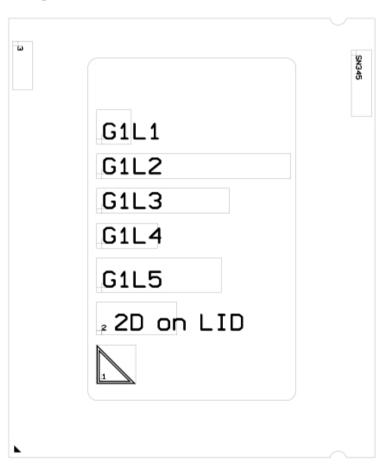

<sup>2.</sup> The Extended Model, Bits [19:16] in conjunction with the Model Number, specified in Bits [7:4], are used to identify the model of the processor within the processor's family.

- 3. The Family Code corresponds to Bits [11:8] of the EDX register after RESET, Bits [11:8] of the EAX register after the CPUID instruction is executed with a 1 in the EAX register, and the generation field of the Device ID register accessible through Boundary Scan.
- 4. The Model Number corresponds to Bits [7:4] of the EDX register after RESET, Bits [7:4] of the EAX register after the CPUID instruction is executed with a 1 in the EAX register, and the model field of the Device ID register accessible through Boundary Scan.
- 5. The Stepping ID in Bits [3:0] indicates the revision number of that model. Refer table above for the processor stepping ID number in the CPUID information.
- 6. Refer to Processor BIOS Specification for additional information. When EAX is initialized to a value of '1', the CPUID instruction returns the Extended Family, Extended Model, Processor Type, Family Code, Model Number and Stepping ID value in the EAX register. The EDX processor signature value after reset is equivalent to the processor signature output value in the EAX register.

Cache and TLB descriptor parameters are provided in the EAX, EBX, ECX and EDX registers after the CPUID instruction is executed with a 2 in the EAX register.

Component Marking Information Figure 2-1. S-Series Chip Package LGA Top-Side Markings

Pin Count: 1851 Package Size (width x height): 37.5mm x 45mm

## **Summary Tables of Changes**

The following tables indicates the Specification Changes, Errata, Specification Clarifications or Documentation Changes which apply to the listed processor stepping. Intel may intend to fix some of the errata in a future stepping of the component and to account for the other outstanding issues through documentation or Specification Changes as noted. These tables use the following notations:

Codes Used in Summary Table

| Stepping                 | Description   |
|--------------------------|---|
| (No mark) or (Blank box) | This erratum is fixed or does not apply to the listed stepping or specification change does not apply to the listed stepping. |

04/01/2025

Doc. No.: 834774, Rev.: 007

| Status   | Description  |
|----------|--|
| Plan Fix | This erratum may be fixed in a future hardware stepping, firmware, or software update. |
| Fixed    | This erratum has been previously fixed in Intel hardware, firmware, or software.       |
| No Fix   | There are no plans to fix this erratum.  |

Errata Summary Table

| Functions | Process   | or Line   |           |           |           |   |  |

## **Errata Details**

| ARL001  | Single Step on Branches Might be Missed When VMM Enables<br>Notification On VM Exit   |
|---------|---|
| Problem | Under complex micro-architectural conditions, single step on branches (IA32_DEBUGCTLMSR (Offset 1D9h, bit [1]) and also TF flag in EFLAGS register is set) in guest might be missed when VMM enables notification on VM Exit (IA32_VMX_PROCBASED_CTLS2 MSR, Offset 48Bh, bit [31]) while the dirty access bit is not set for the code page (bit [6] in paging-structure entry). |

| Implication | When a single step is enabled under the above condition, some single step branches will be missed. Intel has only observed this erratum in a synthetic test environment. |
|-------------|--|
| Workaround  | None identified.   |
| Status      | For the steppings affected, refer to the <u>Summary Table of Changes</u> .   |

| ARL002      | Intel <sup>®</sup> VT-d Remapping Hardware Does Not Perform Reserved(0)<br>Check on PGSNP Field of Scalable-mode PASID Table Entry  |
|-------------|---|
| Problem     | Intel <sup>®</sup> VT-d remapping hardware does perform Reserved(0) check on Page Snoop (PGSNP) field in scalable-mode Process Address ID (PASID) table entry when Snoop Control capability is defined as not available in the Extended Capability Register Offset 10h bit 7 (ECAP.SC=0). |
| Implication | There are no known functional implications due to this erratum. Intel has not observed this erratum with any commercially available software.   |
| Workaround  | None identified.  |
| Status      | For the steppings affected, refer to the <u>Summary Table of Changes</u> .  |

| ARL003 | N/A. Erratum has been removed. |
|--------|--------------------------------|
|--------|--------------------------------|

| ARL004 MSI From VMD-Owned Device May Pass Memory Write |  |
|--|--|
|--|--|

| Problem     | When the storage subsystem is configured to operate in RAID 0 or 1 mode, a Message Signaled Interrupt (MSI) from an Intel® Volume Management Device (Intel® VMD) owned device may interrupt a core before a previous write from the device is completed. |
|-------------|--|
| Implication | Due to this erratum, the platform may experience unpredictable system behavior.  |
| Workaround  | None identified. The VMD MSI interrupt-handler should initially perform a dummy register read to the MSI initiator device prior to any writes to ensure proper PCIe ordering.  |
| Status      | For the steppings affected, refer to the <u>Summary Table of Changes</u> .   |

| ARL005      | USB 3.2 Device May Not Function as Expected With TC10 Enabled  |
|-------------|--|
| Problem     | When TC10 is enabled, a USB 3.2 device connected to USB Type-C port directly without retimer may not function as expected. |
| Implication | Due to this erratum, a USB 3.2 device may not function as expected.  |
| Workaround  | None identified. It may be possible for the BIOS to contain a mitigation for this erratum.                                 |
| Status      | For the steppings affected, refer to the <u>Summary Table of Changes</u> .   |

| ARL006  | PCONFIG Error Reporting May be Incorrect   |
|---------|--|
| Problem | If invalid parameters are provided, the PCONFIG instruction should generate a #GP exception. Due to this erratum, the processor may instead set a ZF flag, with EAX reporting failure reasons. |

| Implication | Due to this erratum, incorrectly configured PCONFIG usage may lead to unexpected error reporting. |
|-------------|---|
| Workaround  | None identified.  |
| Status      | For the steppings affected, refer to the <u>Summary Table of Changes</u> .                        |

| ARL007      | DP Monitor May Not Operate After S4/S5 Resume   |
|-------------|---|
| Problem     | When switching a USB Type-C Display Port (DP) monitor connection between Alt Mode and MFD in S4/S5, the monitor may not be enumerated when resuming from S4/S5. |
| Implication | Due to this erratum, a DP Monitor may not operate when resuming from S4/S5 and may require a hot plug to recover.   |
| Workaround  | None identified.  |
| Status      | For the steppings affected, refer to the <u>Summary Table of Changes</u> .  |

| ARL008      | PCIe Root Port Lane Error Status Register May Not be Cleared   |
|-------------|--|
| Problem     | Re-enabling a port following a link disable or hot reset the PCIe Lane<br>Error Status register (Offset 0xA38) may not be cleared.                                     |
| Implication | Due to this erratum, the Lane Error Status register may indicate lane errors on some of the Root Ports. Intel has not observed any functional issues due this erratum. |

| Workaround | None identified. Software should ignore the lane error status register to mitigate this erratum. |  |
|------------|--|--|
| Status     | For the steppings affected, refer to the <u>Summary Table of Changes</u> .                       |  |

| ARL009      | Type-C Display May be Blank Following S3/S4/S5 Resume  |
|-------------|--|
| Problem     | When switching between Type-C Display Alt Mode and a Multi-Function Device (MFD) while the system is in S3/S4/S5, the Display may not enumerate. |
| Implication | When this erratum occurs, the Display may be blank. A device unplug and re-plug may be necessary to recover the display.                         |
| Workaround  | None identified.   |
| Status      | For the steppings affected, refer to the <u>Summary Table of Changes</u> .   |

| ARL010      | Performance Monitoring Event Branch Instruction Retired Will Not<br>Count CALLs to Next Sequential Instruction  |
|-------------|---|
| Problem     | A CALL instruction whose target is the next sequential instruction (the same address pushed onto the stack) will not increment the performance monitoring event BR_INST_RETIRED (Event: C4H, UMask: 00H, F9H).                |
| Implication | Due to this erratum, software monitoring Branch Instruction Retired events may undercount. Since the CALL is to the next instruction, control flow tracing with the Last Branch Retired (LBR) records should not be affected. |
| Workaround  | None identified.  |

| Status | For the steppings affected, refer to the <u>Summary Table of Changes</u> . |
|--------|--|
|--------|--|

| ARL011      | Performance Monitoring Event Branch Instruction Retired Will<br>Overcount on Certain Types of Branch and Complex Instructions  |
|-------------|--|
| Problem     | On certain types of branch and complex instructions, the performance monitoring event BR_INST_RETIRED (Event: C4H, UMask: 00H / 7EH / BFH / C0H / DFH / EBH / FBH / F9H) will overcount by 1. Affected instructions include FAR CALL/JMP, RETF, IRET, VMENTRY/VMEXIT/VMPTRLD, and complex SGX/SMX/CSTATE instructions/flows. |
| Implication | Due to this erratum, software monitoring Branch Instruction Retired events may overcount.  |
| Workaround  | None identified.   |
| Status      | For the steppings affected, refer to the <u>Summary Table of Changes</u> .   |

| ARL012      | Processor Trace May Generate PSB Packets Too Infrequently  |
|-------------|--|
| Problem     | A Packet Stream Boundary (PSB) packet should be generated for every PSBFreq number of trace output bytes. Due to this erratum, PSB packets may be generated only after as many as four times that number of output bytes have been generated.  |
| Implication | Due to this erratum, trace decoder software may see fewer PSB packets than expected. This may lead to the trace decoder software needing to search further to find a starting point to decode or, when used in circular mode, being unable to decode the trace due to lacking any PSB packets. |

| Workaround | None identified. The software can request more frequent PSB packets by programming PSBFreq (bits[27:24]) of IA32_RTIT_CTL MSR (570H) to a value 1/4 of the desired value. |
|------------|---|
| Status     | For the steppings affected, refer to the <u>Summary Table of Changes</u> .  |

| ARL013      | Unsynchronized Cross-Modifying Code Operations Can Cause<br>Unexpected Instruction Execution Results   |
|-------------|--|
| Problem     | The act of one processor or system bus master writing data into a currently executing code segment of a second processor with the intent of having the second processor execute that data as code is called cross-modifying code (XMC). XMC that does not force the second processor to execute a synchronizing instruction prior to execution of the new code is called unsynchronized XMC. Software using unsynchronized XMC to modify the instruction byte stream of a processor can see unexpected or unpredictable execution behavior from the processor that is executing the modified code. |
| Implication | In this case, the phrase "unexpected or unpredictable execution behavior" encompasses the generation of most of the exceptions listed in the Intel Architecture Software Developer's Manual Volume 3: System Programming Guide including a General Protection Fault (GPF) or other unexpected behaviors. In the event that unpredictable execution causes a GPF the application executing the unsynchronized XMC operation would be terminated by the operating system.  |
| Workaround  | In order to avoid this erratum programmers should use the XMC synchronization algorithm as detailed in the Intel Architecture Software Developer's Manual Volume 3: System Programming Guide Section: Handling Self- and Cross-Modifying Code.   |
| Status      | For the steppings affected, refer to the <u>Summary Table of Changes</u> .   |

| ARL014 | N/A. Erratum has been removed. |
|--------|--------------------------------|
|--------|--------------------------------|

| ARL015      | Performance Monitoring Events TOPDOWN.BACKEND_BOUND_<br>SLOTS and IDQ_BUBBLES May be Inaccurate   |
|-------------|---|
| Problem     | The performance monitoring events TOPDOWN.BACKEND_BOUND_SLOTS (Event A4h, UMask 02h) and IDQ_BUBBLES.* (Event 9Ch, UMask 01h) may not count when the processor is in the C0.2 power sub-state, which is entered via the TPAUSE or UWAIT instructions. This erratum also impacts the accuracy of MSR_PERF_METRICS fields Frontend Bound, Backend Bound, and Fetch Latency (MSR 329h, Bits [23:16], [31:24] and [55:48]). |
| Implication | Due to this erratum, these performance monitoring events and the fields in MSR_PERF_METRICS may be inaccurate.  |
| Workaround  | None identified.  |
| Status      | For the steppings affected, refer to the <u>Summary Table of Changes</u> .  |

| ARL016      | Performance Monitoring Event IDQ.MS_UOPS May Undercount  |
|-------------|--|
| Problem     | The performance monitoring events IDQ.MS_UOPS, IDQ.MS_<br>SWITCHES, and IDQ.MS_CYCLES_ANY (Event 79h, UMask 30h) may<br>undercount MS_UOPS that come from the Decode Stream Buffer<br>(DSB). |
| Implication | Due to this erratum, performance monitoring counters may report counts lower than expected.  |
| Workaround  | None identified. Performance monitoring event UOPS_RETIRED.MS may be used instead.   |
| Status      | For the steppings affected, refer to the <u>Summary Table of Changes</u> .   |

| ARL017      | Performance Monitoring Event INT_VEC_RETIRED.MUL_256 May Undercount   |
|-------------|---|
| Problem     | The performance monitoring event INT_VEC_RETIRED.MUL_256 (Event E7h, Umask 80h) may not count VPMULLQ instructions. |
| Implication | Due to this erratum, the performance monitoring event may report lower counts than expected.                        |
| Workaround  | None identified.  |
| Status      | For the steppings affected, refer to the <u>Summary Table of Changes</u> .  |

| ARL018      | VM Exit Qualification May Not be Correctly Set on APIC Access While<br>Serving a User Interrupt  |
|-------------|--|
| Problem     | A VM Exit that occurs while the processor is serving a user interrupt in non-root mode should set the "asynchronous to instruction execution" bit in the Exit Qualification field in the Virtual Machine Control Structure (bit 16). However, if a VM Exit occurs during processing a user interrupt due to an APIC access, the bit will not be set. |
| Implication | Due to this erratum, the "asynchronous to instruction execution" bit will not be set if an APIC Access VM Exit occurs while the processor is serving a user interrupt. Intel has not observed this erratum with any commercially available software.   |
| Workaround  | None identified.   |
| Status      | For the steppings affected, refer to the <u>Summary Table of Changes</u> .   |

| ARL019      | PCIe REFCLK Inactive Prior to PERST#   |
|-------------|--|
| Problem     | PCIe differential reference clocks may go inactive prior to the assertion of PERST#.   |
| Implication | Due to this erratum, the PCI Express® Card Electromechanical Specification, Revision 5.0, Version 1.0 Power Section 2.2.2 "Management States (S0 to S3/S4 to S0)" requirement is not followed. Intel has not observed any functional implications due to this erratum. |
| Workaround  | None identified.   |
| Status      | For the steppings affected, refer to the <u>Summary Table of Changes</u> .   |

| ARL020      | Locked Page Split Access May Not be Detected by UC-lock Disable if<br>Split-lock Disable is Not Used   |
|-------------|--|
| Problem     | The UC-lock disable feature (MSR_MEMORY_CTRL bit [28] (MSR 33h)) may not cause a fault (#AC(4)) for a page split lock that accesses a page with non-WB memory type if the split lock disable (MSR_MEMORY_CTRL bit [29]) is not set.  |
| Implication | Due to this erratum, system software may not be able to fully prevent bus locks due to locks to non-WB memory unless they use the split-lock disable feature to prevent bus locks due to splits. Intel has not observed this erratum with any commercially available software. |
| Workaround  | None identified. Software using the UC-lock disable feature should also enable the split lock disable feature.   |
| Status      | For the steppings affected, refer to the <u>Summary Table of Changes</u> .   |

| ARL021      | Precision Time Measurement (PTM) Interpretation Capability Bit<br>Incorrect Register Offset   |
|-------------|---|
| Problem     | The PTM Propagation Delay Adaptation Interpretation B (PTMPDAIB) Bit is implemented at Configuration Space (CFG) Offset 158h instead of at 50h as documented in the PCI-SIG PTM Byte Ordering Adaptation Engineering Change Notice (ECN). |
| Implication | End Point Device (EPD) software that implements the PTM Byte Ordering Adaptation ECN will not be able to program their PTMPDAIB Bit correctly since it is located at a different register offset.   |
| Workaround  | None identified. To mitigate this issue, EPD software that implements the PTM Byte Ordering Adaptation ECN must access PTMPDAIB at CFG Offset 158h.   |
| Status      | For the steppings affected, refer to the <u>Summary Table of Changes</u> .  |

| ARL022      | Display Artifacts With YUV420 Format  |
|-------------|---|
| Problem     | While in DP2.1 UHBR mode and using the YUV420 format with scaling, displays with a resolution higher than 5K @ 60Hz may show display artifacts. |
| Implication | Due to this erratum, display artifacts may be seen.   |
| Workaround  | None identified.  |
| Status      | For the steppings affected, refer to the <u>Summary Table of Changes</u> .  |

| ARL023      | Processor C-States With USB Full-Speed or Low-Speed Device<br>Hotplug  |
|-------------|--|
| Problem     | When doing a hotplug on a USB hub with two or more USB Full-speed or Low-speed devices each with a 1 ms service interval interrupt endpoint, a race condition may occur between the PMC and the xHCI controller. |
| Implication | The processor may fail to enter C3 or deeper package C-States. Note:<br>This erratum has only been observed in a synthetic environment.  |
| Workaround  | None identified. This condition is recovered after the xHCI controller has successfully entered D3.  |
| Status      | For the steppings affected, refer to the <u>Summary Table of Changes</u> .   |

| ARL024      | xHCl Out of Order ACK Due to LCRD1   |
|-------------|--|
| Problem     | A delay in the availability of LCRD1 (Link Credit 1) from a USB 3.2 hub, with two or more downstream USB 3.2 bulk endpoint devices engaged in SuperSpeedPlus concurrent transfers, may lead to the connected xHCI controller sending the ACK and Status of a transfer packet out of order. |
| Implication | Due to this erratum, a USB 3.2 bulk endpoint device may not respond to subsequent transfers. It may be possible for a device driver to recover the USB 3.2 device.   |
| Workaround  | None identified.   |
| Status      | For the steppings affected, refer to the <u>Summary Table of Changes</u> .   |

| ARL025      | Non Canonical Fault May be Signaled on Access That Wraps Address<br>Space When LAM is Enabled   |
|-------------|---|
| Problem     | When Linear Address Masking (LAM) is enabled, a non-canonical fault may be signaled if there is an access which splits the 64-bit linear address space (and thus touches both linear address FFFF_FFFF_FFFF_FFFF and 0h). |
| Implication | Due to this erratum, software may receive an unexpected exception on such accesses. Intel has not observed this erratum with any commercially available software.   |
| Workaround  | None identified.  |
| Status      | For the steppings affected, refer to the <u>Summary Table of Changes</u> .  |

| ARL026      | Processor May Encrypt TME Exclude Range if Mapped to Remap<br>Range  |
|-------------|--|
| Problem     | The processor accesses to TME exclude range may be encrypted but not decrypted if mapped to remap range.                   |
| Implication | Due to this erratum, the processor exclude range it will be encrypted but will but not decrypted if mapped to remap range. |
| Workaround  | It may be possible for BIOS to workaround this erratum.  |
| Status      | For the steppings affected, refer to the <u>Summary Table of Changes</u> .   |

| ARL027      | SPI0 Dual IO Mode With SPI0_IO2 And SPI0_IO3 Connected to SPI<br>Device   |
|-------------|---|
| Problem     | On systems with dual IO mode enabled, SPI0_IO2 and SPI0_IO3 may momentarily drive low before these signals are pulled high by internal resistors during boot from the G3 state. |
| Implication | Due to this erratum, unexpected system behavior may occur on systems when SPIO_IO2 and SPIO_IO3 signals are connected to an SPI device.   |
| Workaround  | None identified. To mitigate this erratum, do not connect SPI0_IO2 and SPI0_IO3 to an SPI device in SPI0 dual IO mode enabled systems.  |
| Status      | For the steppings affected, refer to the <u>Summary Table of Changes</u> .  |

| ARL028      | Cache Level Wrongly Reported in Machine Check Banks  |
|-------------|--|
| Problem     | When reporting a machine check in the module level caches (IA32_MC1_STATUS, MSR 405H), a Compound Error Code of type Cache Hierarchy Error will be reported with a Level (LL) Sub-field of 0b10[L2] instead of 0b01[L1]. |
| Implication | Due to this erratum, system software relying on this data, may wrongly categorize the cache level in which the error was reported. The severity of the error will be reported accurately.                                |
| Workaround  | None identified.   |
| Status      | For the steppings affected, refer to the <u>Summary Table of Changes</u> .   |

| ARL029      | Incorrect Core TLB Entry May be Retrieved Following VM Exit   |
|-------------|---|
| Problem     | An incorrect Core TLB entry may be retrieved when the retrieval is not completed prior to VM exit.  |
| Implication | Due to this erratum, hypervisor software may read an invalidvalue following VM exit, leading to Windows Bug Check HYPERVISOR_ERROR (20001h)or SECURE_KERNEL_ERROR (18Bh). |
| Workaround  | It may be possible for the BIOS to workaround this erratum.   |
| Status      | For the steppings affected, refer to the <u>Summary Table of Changes</u> .  |

| ARL030      | Higher Than Expected Power Consumption With VR Slow Slew Rate<br>Enabled  |
|-------------|---|
| Problem     | On a system with acoustic noise mitigation Voltage Regulator (VR) Slow Slew Rate (SSR) enabled, the latency values may not be correctly calibrated.                   |
| Implication | Due to this erratum , the system may experience lower than expected Deepest Run-time Idle Platform State (DRIPS) leading to a higher than expected power consumption. |
| Workaround  | It may be possible for the BIOS to contain a workaround for this erratum.   |
| Status      | For the steppings affected, refer to the <u>Summary Table of Changes</u> .  |

| ARL031      | Unexpected System Behavior Following S0ix/S4/Warm Reset   |
|-------------|---|
| Problem     | Longer than expected processor core power state exit latencies during warm reset or S0ix/S4 flows may delay core wake up.                                       |
| Implication | Due to this erratum, a system hang with bug check BSOD SYNTHETIC_<br>WATCHDOG_TIMEOUT (1CAh), audio glitches, or other unexpected<br>system behavior may occur. |
| Workaround  | It may be possible for the BIOS to contain a workaround for this erratum.   |
| Status      | For the steppings affected, refer to the <u>Summary Table of Changes</u> .  |

| ARL032      | Unexpected Core C-State Auto-Demotion   |
|-------------|---|
| Problem     | An incorrect P-core telemetry counter value on package C10 exit may lead to an unexpected core C-State Auto-Demotion. |
| Implication | Due to this erratum, higher than expected package CO residency may be observed.                                       |
| Workaround  | It may be possible for the BIOS to contain a workaround for this erratum.   |
| Status      | For the steppings affected, refer to the <u>Summary Table of Changes</u> .  |

| ARL033 RDTSC Instructions May Return Non-Incremental Value |
|--|
|--|

| Problem     | During an increase in processor frequency, two consecutive RDTSC instructions may return the same value.                                 |
|-------------|--|
| Implication | Due to this erratum, software that relies upon the processor monotonically incrementing the time-stamp counter may function incorrectly. |
| Workaround  | It may be possible for the BIOS to contain a workaround for this erratum.  |
| Status      | For the steppings affected, refer to the <u>Summary Table of Changes</u> .   |

| ARL034      | Processor May Not Enter Package State C3 or Deeper   |
|-------------|--|
| Problem     | During PCIe device LO exit, PCIe Latency Tolerance Reporting (LTR) may not update correctly, resulting in the processor not entering Package State C3 or deeper. |
| Implication | Due to this erratum, higher than expected power consumption may occur.   |
| Workaround  | It may be possible for BIOS to contain a workaround for this erratum.  |
| Status      | For the steppings affected, refer to the <u>Summary Table of Changes</u> .   |
